1. GENERAL SAFETY

1.1 INTRODUCTION

HERCULES HOISTS LIMITED has taken all practical care in the design and manufacture of its “Indef” brand products to ensure that they are safely constructed. However, the use of material handling equipment’s presents hazards, which cannot be prevented by mechanical means and are related to the manner in which the material handling equipment’s are used.

Operators must be competent, physically and mentally fit and properly trained in the safe operation of material handling equipment’s and the handling of loads.

Safety Instructions must form part of the safety rules for any plant where any material handling equipment is used, serviced or repaired.

It is impossible to foresee all operating conditions and it must remain the responsibility of the operator to anticipate and avoid any unsafe conditions not covered in detail in this manual.

No machine is entirely safe unless it properly maintained. It is important to practice a program of periodic inspection and preventative maintenance.

The material handling equipment’s detailed in this manual, are designed to transport loads using the equipment supplied for the specific purpose. The equipment must not be used for any other purposes. Lifting / transporting human beings are strictly prohibited.

The safety information must be read and understood by all personnel before commencing operation or maintenance.

1.2 SAFE WORKING LOAD

The safe workings load is that load indicated on capacity plate of the unit. This is the maximum load that may safely be handled. Under no circumstances should a load greater than the SWL be suspended to the trolley.

1.3 ELECTRICAL SAFETY

1. Ensure proper earthing.
2. Isolate power supply before opening the control panel.
3. All electrical related work should be carried out by trained and qualified person.
4. Check and tighten the power & control wiring if loose to avoid loose connections.

2. INSTALLATION AND COMMISSIONING

2.1 PRE-INSTALLATION CHECKS

1. Check for transit damage.
2. Check that all fasteners and joints are tight and secure.
3. Check the capacity of the unit.

2. 2.2 TRAVELLING TROLLEY

The runway beam or girder should be of correct size, of adequate strength with an even running surface. The running surface should be levelled properly. Where it is possible to install the unit onto the beam without dismantling the trolley, the trolley should be positioned on the beam and end stops fitted to both ends of the beam.

Where it is necessary to dismantle the trolley in order to install the trolley on the beam, the trolley has to be set to the correct track width. Ensure that adequate end stops are fitted to the runway beam.

2. 2.3 TROLLEY ADJUSTMENT

1. Measure the beam width to be used and add a nominal 3mm to 4mm to this width, for running clearance (1%mm to 2mm each side).
2. Remove trolley cross bolt nuts.
3. By transferring the required number and thickness of adjusting washers from the outside to the inside of the side plates, or vice versa, as required, the necessary setting can be achieved. There must always be at least one adjusting washer outside the side-plates on each cross bolt, under each of the four large nuts.
4. Ensure that, between the side plates, the adjusting washers are equally disposed on both sides of the yoke or suspension plate(s) and also equally disposed between both cross bolts. This ensures the yoke or suspension plate(s) remain central and lie square to the side plates and parallel to the plane of the beam.
5. After re-fitting the yoke or suspension plate(s), distance tubes, and required number of adjusting washers between the side plates, replace all remaining washers on the cross bolts outside the side-plates.
6. If the trolley has hand-gear travel, it may be necessary to offset the cross bolts by placing the remaining washers at one end of the cross bolts to gain clearance between the hand chain and the ends of the cross bolts. Tighten the main cross bolt nuts firmly, ensuring that runners are correctly aligned.
7. In case of hand geared-trolley anti tipping stops are provided for preventing over tilting of trolley. The stop is to be adjusted as under at the time of installation of trolley :

- A) Unlock two nuts provided at the center of trolley side plate.
- B) Move the stopper up or down in slot as required so that distance between bottom of the I-beam and top surface of stopper will be @ 2mm.
- C) Tighten the two nuts properly so as to hold stopper in position.

2. 2.4 COMMISSIONING

All units are tested, in accordance with Statutory requirements, and a test Certificate is supplied.

On completion of installation, before the hoist is put into regular service, the following procedure should be carried out.

1. Check that all joints and fasteners are tight and secure.
2. Operate the equipment with both, “no load” and “full load” and check that the operation is smooth at all times.
3. Travelling units - run throughout the full extent of the runway, ensuring adequate clearance at all times and end stoppers are correctly positioned.

2. 2.5 ROUTINE EXAMINATION

The trolley should be regularly inspected for damage and wear and to ensure that it is operating smoothly. Where the trolley is used infrequently, a visual check should be made of the trolley each time it is used.

The following is a guide to routine checks, which should be carried out on a trolley, which is used in normal operation conditions. Where a trolley is used or stored outdoors or in corrosive or abrasive conditions, inspection and lubrication must be attended to more frequently.

2.6 INSPECTION CHECK-LIST

Trolley

Side Plates	Inspect visually	Must not be cracked or damaged. Cross bolt holes must not be elongated.
Cross Bolts	Inspect visually	Must not be bent
Trolley Runners	Inspect visually	Must not be cracked, damaged or worn and must rotate freely.
Gearing (traverse shaft and geared runners where fitted)	Inspect visually	Gear teeth must not be chipped, flattened, deformed or damaged. Traverse shaft must be secure and not bent or deformed. There must be no movement or play between the shaft and the hand chain wheel.
Hand Chain Wheel (Geared Travel only)	Inspect visually	Wheel must not be cracked or damaged. Chain pockets must not be deformed.

3 . SPARE PARTS

To ensure compatibility of parts, it is recommended that spares be obtained from Authorized dealers of INDEF. When ordering spare parts, quote the serial number, the unit capacity, the part number, description, Drawing number and quantity required.

3.1 MAINTENANCE

Statutory regulations require that the trollies should be inspected and certified at regular intervals by a competent person. This is a safety measure, and to fulfill both this requirement and to obtain the most efficient and reliable operation, the trolley should be regularly serviced and maintained.

LUBRICATION

Lubrication must be carried out regularly, at the intervals specified and when the hoist is dismantled for overhaul or repair.

In high duty use or in abrasive, corrosive or hot environments, the hoist may require more frequent attention and frequencies given below must be regarded as a minimum.

PART	LUBRICANT	APPLICATION	FREQUENCY
TROLLEY	HP		
Runner Bearings required	Grease	Pressure packed during	No re-lubrication manufacture.
Traverse Shaft (Geared travel only)	Tisona - M2	Liberally smear the bush ends where these mate with another surface.	Re-lubricate only after stripping the trolley for the replacement of parts.
Spur Gearing (Geared travel only)	Tisona - M2	Clean all gears and apply fresh lubricant ensuring full cover, without allowing any lubricant onto the runner treads.	Every 6 months
Gear Box (Electric Trolley)	Grease	Apply on gear and pinion	Every 6 months

6. SPARE PARTS FOR MOTOR WITH BRAKE SYTCO BRAKE

PART NO.	PART CODE	DESCRIPTION
	XBAP0060SYT	MAIN BRAKE
1	XBAP01610SSYT	STATOR
2		ARMATURE ASSEMBLY
3		TUBULAR SPRING EACH SET
4	XBAP87210SSYT	MOUNTING FLANGE ASSLY
6		BRAKE DISC & BRAKE LINER (ROTOR / GEAR HUB)
10	XBAP00510SYT	MOUNTING FLANGE

TROLLEY BRAKE MAINTENANCE / REPAIR

TROUBLE	POSSIBLE CAUSE	REQUIRED ACTION
Brake does not apply No braking action	No mains voltage. Stator (coil) open. Armature plate Jammed (without moment)	Check supply voltage. Brake coil resistance to be checked as per the technical data. Springs, guide bushes must be checked and overhauled (cleaned properly).
Brake action too slow,	Oil or grease on the friction lining Spring are present/broken Brake lining worn-out	Replace rotor, prevent oil/grease from coming in contact with friction liner. Dismantle brake, loosen sleeves insert new springs. Replace rotors (armature plate and flange if very badly worn-out).

To ensure safe & trouble free operation, Spring Loaded Brakes must be checked and maintained at regular intervals. SYTCO Spring Loaded Brakes are wear – resistant and designed for trouble free longer life. The Friction Liners are subject to function -related wear. The Brakes must be checked and readjusted at regular intervals & if necessary, it should be replaced.

PRINCIPLE OF OPERATION : This type of brake consists of stator, Armature, Rotor & Mounting flange. Current is given to stator (coil), the armature plate is attracted to the stator against the spring force thus releasing the rotor. When current is off, strong compression springs push the armature plate back to its position thus clamping the rotor in between armature & mounting flange and providing necessary braking torque.

INSTALLATION : Mounting flange (10) has to be mounted on motor/machine body which should be at right angle to the motor/machine shaft as well as centered internally and externally may be with the help of spigot. The hub (6) has to be fitted on shaft with the help of key and axial retainer (circlip) and Rotor (9) on that. Stator (1) with Armature Assembly (2) has to be fitted on the Mounting flange (10) with the help of provided Allen bolt (8) through adjustment Hollow Bushes (4). The air gap should be adjusted by adjustable Hollow Bushes. To reduce air gap, rotate all bushes equally clockwise. Air gap should be within limits as per following table, initially it should be nominal.

Brake size	05	10	20	40	70	90	160	250
Nominal air gap mm	0.2	0.3	0.3	0.3	0.3	0.4	0.5	0.5
Maximum air gap mm	0.5	0.7	0.7	0.7	0.8	1.0	1.0	1.0

MAINTANENCE : SYTCO Fail Safe Brakes are almost maintenance free. For this periodicity depends on application to application, operating frequency, system inertia to be stopped etc. air gap can be adjusted by rotating adjustable Hollow Bushes to reduce air gap. Rotate all bushes anti-clockwise and check from all sides by filler gauge and vice-versa.

TYPICAL CASES OF WRONG FITMENT

Typical case of uneven air gap in brake disc: This should be noticed and avoided during preventive maintenance.

Typical case of stator resting bolt head, which will restrict the stator lateral movement of brake disc: This should be noticed and avoided during preventive maintenance.

Typical case of stator fitting, the half-moon slot is to clear the bolt head, brake housing fitment wrong, which will obstruct the stator lateral movement of brake disc: This should be noticed and avoided during preventive maintenance.

TYPICAL CASES OF WRONG WIRING

The RYB colour code of connecting cables to be maintained and wiring connections to be followed accordingly. The supply voltage is $415 \pm 10\%$ for all AC brakes. The power supply fluctuations will have effect on brake coil first than motor as coil are more sensitive than motor windings.

From harbouring a simple dream of becoming a provider of high-quality, truly Indian material handling solutions to becoming the national market leaders, **Bajaj Indef** has journeyed far and long. Right from our incorporation in 1962 till the present day, innovation, excellence, service and customer focus have been some of the key pillars that have carried us thus far and we only aim to take this legacy forward.
